1. VEGETATION SAMPLING AND CLASSIFICATION

Introduction

This report presents the results of the vegetation classification portion of the NPS/USGS BRD Vegetation Mapping Program at Fort Laramie National Historic Site. Sampling strategy and field methods are described for both plot and accuracy assessment sampling. The vegetation classification, field key to the vegetation types, and descriptions of each type are also included. As a supplement to this report, the raw plot data and accuracy assessment points are included as original field forms and in electronic form in the PLOTS database (a Microsoft Access database).

Methods

In general, the field methods used for developing the classification followed the standards outlined in the Field Methods for Vegetation Mapping document produced for this project. This began with the development of a preliminary vegetation classification based on literature review and an initial visit to the site. The preliminary classification was used to identify polygons delineated from aerial photos. Due to the small size of the mapping area it was not deemed necessary to limit sampling to subsets of the whole area or to stratify it based on environmental or other factors. Although environmental information was not used to stratify the mapping area, data were collected from across a range of conditions on the mapping area to capture as much of the variation in the vegetation as possible. The field team performed a reconnaissance of the mapping area, collecting limited environmental and vegetation information from points (called observation points) across the area. These points were used to refine the classification before detailed plot sampling began. Plot data and observation points were collected from across the entire mapping area, not just within the boundaries of Fort Laramie NHS. Getting access to lands within the mapping area but beyond the boundaries of Fort Laramie NHS was not difficult because all such land was public land.

Within polygons, plots were subjectively placed in vegetation that was judged to be representative of the whole polygon. In some polygons this was difficult because dominant species were distributed in patches. In these cases, the patchiness was noted on the field forms. Total number of plots and observation points per vegetation type was related to areal coverage of each vegetation type, widespread types had more plots than those with limited distribution. The combined number of plots (49) and observation points (53) varied from 0-21 per type, with an average of 6.4 per type. Plot size also varied with vegetation type. Woodland communities were sampled with 20 x 20 m plots. Shrub and herbaceous dominated communities were sampled with 10 x 10 m plots, and sparsely vegetated communities were sampled with 5 x 5 m plots.

Both plots and observation points were used to produce the final classification of Fort Laramie NHS. Field personnel organized the plots and observation points into groups based on vegetation structure and composition. Average cover of each species and vegetation stratum were computed. The plots were analyzed using an ordination technique, Detrended Correspondence Analysis (DCA), and a clustering algorithm, Unweighted Pair-Group Method Using Arithmetic Means (UPGMA). Because there were few plots per type and the locations of the plots were chosen to represent the variation of a type at Fort Laramie NHS, there was substantial variation within each type. In addition, the extensive history of disturbance has allowed invasive species to become established with the natural vegetation. These factors lessened the utility of the numerical analyses. Thus, the results of the numerical analyses were not used to derive the classification, but were compared to the subjective classification and any discrepancies in plot placement were examined.
Accuracy assessment data were collected following the procedures outlined in the Field Methods for Vegetation Mapping document produced for this project. The amount of data collected for each polygon was the same as that collected for observation points. 180 accuracy assessment points were collected from Sept. 2-Sept. 10, 1997. Points were placed as near to the center of delineated polygons as possible. Polygons in which accuracy assessment was done were spread across the mapping area and chosen by the field team to reflect the relative abundance of vegetation types.

**Results**

The classification of the vegetation at Fort Laramie NHS resulted in 16 types being defined, including one woodland type, one shrubland type, 11 herbaceous types, and three sparsely vegetated types. Three of the herbaceous types are not placed within the National Vegetation Classification System (NVCS). Areas placed within these types are dominated by exotic and/or invasive species. They are so disturbed that they cannot be accurately placed within the natural vegetation subgroup of the NVCS. The names of these three types end with "Community" to signify that they have not been placed in the NVCS.

Many parts of the mapping area that are classified as natural vegetation have been disturbed in the past. This made classification of these areas problematic. Species lists and structure of these areas are different from less disturbed examples of the same community. The most difficult type to place within the NVCS was Bouteloua gracilis - Carex filifolia Herbaceous Vegetation. The examples on Fort Laramie NHS do not closely match the description for this type in other parts of Wyoming, but this appeared to be the closest match for the sites at Fort Laramie NHS. Further comparison of these sites and others like them may result in re-classification.

The classification of Fort Laramie NHS, placed within the NVCS, follows. A field key and descriptions for each of the types are included in later sections of this report.

Riverine Sand Flats - Bars Sparse Vegetation

**Conclusion**

The vegetation of Fort Laramie NHS was classified using the techniques established for the NPS/BRD Vegetation Mapping Program. Most of the vegetation types were placed in the NVCS. Due to disturbance in some areas, some of the vegetation at Fort Laramie NHS did not closely match the more general, national description of the community into which it was placed. In addition, a few types did not fit within the current NVCS and retained park-specific names and descriptions. It is expected that these will be placed within a national hierarchy as the NVCS is further developed.

The general methods outlined for the NPS/BRD Vegetation Mapping Program worked well in this project. There were several factors which contributed to this. The first was that the field team had aerial photographs with preliminary polygons already delineated when they began field work. This made choosing plot and observation point locations much more efficient than would otherwise have been the case, especially given the limited environmental data available. The second was that the field personnel had been involved in mapping other parks for this project. This eliminated the need for training and made for more efficient use of field time. Finally, the small size and relatively gentle terrain of the mapping area made many aspects of the field effort easier.

2. FIELD KEY TO THE PLANT COMMUNITIES OF FORT LARAMIE NATIONAL HISTORIC SITE

1. Sites more than 25% vegetated.

2. More than 10% of the site covered by woody plants more than 3m tall

3. Broadleaf (dicot) trees predominate; site riverine:  
   *Pinus ponderosa / Symphoricarpos occidentalis Woodland*

3. Needleleaf (conifer) trees predominate; upland sites:  
   *Pinus ponderosa / Schizachyrium scoparium Wooded Herbaceous Vegetation*

2. Less than 10% of site covered by woody plants more than 3m tall

4. More than 10% of site covered by woody plants less than 3m tall

5. *Symphoricarpos occidentalis* dominate; site on floodplain: see  
   *Populus deltoides / Symphoricarpos occidentalis Woodland* above  
   (trees maybe sparse or absent)

5. not as above

6. *Salix exigua* or *Populus deltoides* dominate; site riverine:  
   *Salix exigua Shrubland*

6. *Artemisia filifolia* and occasionally *Yucca glauca* dominate shrub stratum; upland sites:  
   *Stipa comata - Yucca glauca Herbaceous Vegetation*

4. Less than 10% of site covered by woody plants less than 3m tall (except for small inclusions).

7. Site riverine or palustrine wetland.

8. *Typha latifolia* dominates:  
   *Typha latifolia Western Herbaceous Vegetation*

8. *Typha latifolia* not dominate.

9. *Spartina pectinata* dominates; site riverine:  
   *Spartina pectinata - Scirpus pungens Herbaceous Vegetation*

9. Intermittently saturated floodplain sites dominated by
sedges and rushes; *Esquisetum laevigatum* may dominate in drier areas:

**Carex nebrascensis** Herbaceous Vegetation

7. Site upland, never saturated in most years.

10. Vegetation dominated by exotic grasses and/or exotic or native weedy forbs.

11. *Bromus inermis* dominates:

**Bromus inermis** Disturbed Community

11. Other species dominate:

**Upland Weedy Community**

10. *(Move to left margin)*

10. Vegetation dominated by native grasses

12. *Pascopyrum smithii* dominant; *Bouteloua gracilis* often present, but codominants variable or entirely absent (includes seeded stands): *Pascopyrum smithii* Herbaceous Vegetation

12. Not as above; *Pascopyrum smithii* occasionally present, but other grass species more abundant.

13. Dominant species include *Stipa comata, Bouteloua gracilis*, and/or *Carex filifolia*: *Stipa comata - Bouteloua gracilis - Carex filifolia* Herbaceous Vegetation

13. not as above

14. *Sporobolus cryptandrus* dominant; *Buchloe dactyloides* sometimes present and locally dominant; *Bromus tectorum* often abundant (not apparent late in season): *Sporobolus cryptandrus* Disturbed Community

14. Small sites (less than 0.25 ha) dominated by other grass species such as *Poa pratensis, Sporobolus airoides* and *Agropyron cristatum* should be treated as inclusions in the surroundings polygons.
1. Site less than 25% vegetated

15. Riverine sites; may include small stands of *Salix exigua* and young *Populus deltoides*: 
   **Riverine Sand Flats - Bars Sparse Vegetation**

15. Upland sites.

16. Sandy or gravelly sites on floodplain or in drainage bottoms; *Artemisia campestris* and/or *Opuntia polyacantha* usually dominate:  
   **Upland Sand and Gravel Sparse Vegetation**

16. Sites on ridgetops or slopes.

17. Forb-rich vegetation on small cobbles capping ridges.  
   **Bouteloua gracilis - Carex filifolia Herbaceous Vegetation**

17. not as above

18. Pale, soft sandstone with less than 10% vegetative cover.  
   **Sandstone Rock Outcrop Sparse Vegetation**

18. Other sparsely-vegetated small sites (less than 0.25 ha), such as  
   disturbed areas, low escarpments in grassland, and small  
   outcrops in sparse pine woodland should be treated as  
   inclusions in the surroundings polygons.
3. VEGETATION DESCRIPTION FOR FORT LARAMIE NATIONAL HISTORIC SITE

NOTE: "**" Indicates a new formation to the National Vegetation Classification System

CLASSIFICATION CONFIDENCE LEVEL  1

USFWS WETLAND SYSTEM  Upland

RANGE

Globally

This community is found in western North Dakota, western South Dakota, and Wyoming.

Fort Laramie National Historic Site

This community occurs on the lower floodplain along the Platte and Laramie Rivers, with small isolated stands on the upper floodplain, along the highway north of the park, and north of the canal on the south edge of the park.

ENVIRONMENTAL DESCRIPTION

Globally

This community is on medium to coarse textured alluvial soils on the floodplains of major rivers. The floodplains are both seasonally inundated and subirrigated (Thilenius et al. 1995). The meandering erosional and depositional pattern of rivers maintains and influences this community along rivers (Hanson 1990). It is rarely found at higher elevations in the mountains of eastern Wyoming and western South Dakota (Johnston 1987).

Fort Laramie National Historic Site

This community occurs on the lower floodplain adjacent to rivers, and occasionally on the upper floodplain as isolated stands. It occurs on level ground on alluvial soils.

**DIAGNOSTIC SPECIES**

*Globally*

*Populus deltoides*, *Acer negundo*, *Fraxinus pennsylvanica*, *Symphoricarpus occidentalis*, *Pascopyrum smithii*

**Fort Laramie National Historic Site**

*Populus deltoides*, *Salix amygdaloides*

**VEGETATION DESCRIPTION**

*Globally*

This community is typically dominated by a single deciduous tree species, *Populus deltoides*. In some stands other species, such as *Acer negundo* and *Fraxinus pennsylvanica*, may contribute to the canopy. The tallest trees exceed 15 meters. *Populus deltoides* is a pioneer species that requires moist, sparsely vegetated alluvium to become established from seed, therefore stands of this community are seral. The shrub layer is typically 0.5-1 m tall. It is dominated by *Symphoricarpus occidentalis* and commonly includes *Juniperus scopulorum* and *Rosa* spp. In Wyoming, *Chrysothamnus nauseosus* is present and increases with heavy grazing (Thilenius et al. 1995). The herbaceous layer usually includes *Pascopyrum smithii* and *Elymus trachycaulus*. Weedy species such as *Cirsium arvense*, *Melilotus officinalis*, *Taraxacum officinale*, and *Poa secunda* are very common, especially in the presence of grazing (Jones and Walford 1995, Thilenius et al. 1995). *Maianthemum stellatum* is abundant only where grazing is absent.

*Fort Laramie National Historic Site*

This community typically is dominated by *Populus deltoides* with trees to 20 m or more in height. Large individuals of *Salix amygdaloides* occasionally occur and *Populus angustifolia* and *P. x acuminata* occasionally occur in this community. Canopy coverage can be sparse (5%) or as much as 50%. The subcanopy often contributes substantial cover. In some cases, it is difficult to split canopy from subcanopy due to a continuous range in tree height. *Fraxinus pennsylvanica*, *Populus deltoides*, and *Acer negundo* are the most common subcanopy species. *Symphoricarpus occidentalis* dominates the shrub stratum in some areas, but is often absent or poorly developed. A few small stands of *Prunus virginiana* occur in this community on the east side of the Laramie River west of the Fort Site. Herbaceous stratum composition is quite variable. Most species found in the understory of this community are also typical of *Spartina pectinata*, *Bromus inermis*, or *Pascopyrum smithii*. Herbaceous Vegetation, or Upland Sand and Gravel Sparse Vegetation.

**OTHER NOTEWORTHY SPECIES** Information not available.

**CONSERVATION RANK** G2G3

**RANK JUSTIFICATION**

**DATABASE CODE** CEGL000660

**COMMENTS**

*Globally*

In eastern Montana, Hanson et al. (1990) describe a *Populus deltoides/Symphoricarpus occidentalis* type as a grazing-induced stage of the *Populus deltoides/Cornus sericea* type. This contrasts with information from Wyoming, where Thilenius et al. (1995) found that *Symphoricarpus occidentalis* decreases with grazing and *Chrysothamnus nauseosus* increases.

*Fort Laramie National Historic Site*

*Symphoricarpus occidentalis* is often absent or poorly developed in this community. Stands of *S. occidentalis*
without tree cover are treated as extensions of the nearby stands of *Populus deltoides*. In some stands, *P. deltoides* is absent, and *Salix amygdaloides* dominates the canopy.

**RANGE**

*Globally*
This community is found along rivers and streams in Oregon, Washington, Idaho, Montana, southern Manitoba, Wyoming, Colorado, Oklahoma, Nebraska, South Dakota. It probably extends into North Dakota.

*Fort Laramie National Historic Site*
This community occurs along the Laramie and Platte Rivers and in seepage areas north of the canal.

**ENVIRONMENTAL DESCRIPTION**

*Globally*
This community is found near lakes and streams on recently deposited or disturbed alluvial material. The parent material is alluvial sand, although silt, clay, or gravel may be present. Soil development is poor to absent (Steinauer 1989).
This community occurs on level sites on alluvial soils along the Laramie and Platte Rivers and in seepage areas north of the canal.

### DIAGNOSTIC SPECIES

#### Globally

- *Salix exigua*

#### Fort Laramie National Historic Site

- *Salix exigua*, young *Populus deltoides* (less than 3 m tall)

### VEGETATION DESCRIPTION

#### Globally

The dominant vegetation in this community is short shrubs, usually not more than 4 meters tall. The most common of these is *Salix exigua*. *Salix irrorata* and saplings of *Populus deltoides* or *S. amygdaloides* are also frequently found in the shrub layer. This stratum can have moderate to high stem density in the community as a whole. The species in the shrub layer do not form a closed canopy, allowing significant light to reach the ground layer. There are often patches where the shrub layer is absent. The herbaceous cover is sparse to moderate. Older stands and places with less competition from the shrubs have greater herbaceous cover. The composition of the herbaceous layer can vary greatly. Species that are often found in this community are *Cenchrus longispinus*, *Polygonatum lapathifolium*, *Scirpus americanus*, *Triglochin maritimum*, and *Xanthium strumarium*.

#### Fort Laramie National Historic Site

This community is dominated by *Salix exigua* and/or young *Populus deltoides* (less than 3 m tall). Both species dominate the tall and short shrub strata, and combined cover is usually greater than 50%, sometimes approaching 100%. Herbaceous cover is sparse and quite variable in composition.

### OTHER NOTEWORTHY SPECIES

Information not available.

### CONSERVATION RANK

G5Q

### RANK JUSTIFICATION

#### DATABASE CODE

CEGL001197

### COMMENTS

#### Globally

This community is a primary or early secondary community and requires floods to create new areas on which it can develop. Once established, this community may not exist for more than 10-20 years before it is replaced by a later seral stage (Wilson 1970, Bellah and Hulbert 1979).

#### Fort Laramie National Historic Site

Some stands mapped as this type have very little *Salix exigua* and are dominated by young *Populus deltoides*. Succession to and from this community can be relatively rapid (several years), depending on flood events and rate of growth of the young cottonwoods.

CLASSIFICATION CONFIDENCE LEVEL 3

USFWS WETLAND SYSTEM Upland

RANGE
Globally
This community is found in Montana, Wyoming, Colorado, Idaho, Utah, Nebraska, Saskatchewan, and possibly North Dakota.

Fort Laramie National Historic Site
This community occurs on the floodplain. This type includes the seeded stands east of the Fort Site.

ENVIRONMENTAL DESCRIPTION
Globally
This community occurs on flat to gently sloping topography. Soils are clay, clay loam, and silt loam. It is sometimes found on alluvial fans of small streams. The soils are deep (40-100 cm) and well developed (Godfread 1994).
Fort Laramie National Historic Site
This community occurs on level sites on alluvial soils of the floodplain. Many of the sites were disturbed in the recent past (less than 40 years). This community is occasional in drainage bottoms on Bureau of Land Management land south of the NHS.

Fort Laramie National Historic Site
*Pascopyrum smithii* (as dominant or codominant)

DIAGNOSTIC SPECIES

Globally

*Pascopyrum smithii*

Fort Laramie National Historic Site

VEGETATION DESCRIPTION

Globally
This is a midgrass community. Shrubs are rare. The dominant species grow to approximately 1 meter. *Pascopyrum smithii* is the only constant dominant species and may have 50% cover. Other species such as *Koeleria macrantha* and *Poa* spp. may be locally abundant. Many other species common in midgrass prairies are also found in this community. These include *Artemisia ludoviciana*, *Bouteloua gracilis*, *Nassella viridula*, and *Stipa comata* (Aldous 1924).

Fort Laramie National Historic Site
This community is dominated by *Pascopyrum smithii*. In some areas, few other species occur. The codominant grass species for this community vary. *Bouteloua gracilis* is probably the most common. Other locally dominant species include *Poa pratensis*, *Distichlis spicata* (in seepage areas north of the canal), and *Sporobolus airoides*, as well as those mentioned above. *Bromus tectorum* can be locally abundant. Herbaceous cover typically is in the 25-50% range, and occasionally greater. Height is generally less than 0.5 m. This type includes seeded stands east of the Fort Site, which are composed of *P. smithii* with and without *Bouteloua gracilis*.

OTHER NOTEWORTHY SPECIES Information not available.

CONSERVATION RANK G3G5Q

DATABASE CODE CEGL001577

COMMENTS

Globally
This community is similar to several others that are dominated or co-dominated by *Pascopyrum smithii*. Further work needs to be done to refine the differences in composition and environmental characteristics.

Fort Laramie National Historic Site

*P. smithii* also occurs as a minor component in other grassland types.

CLASSIFICATION CONFIDENCE LEVEL  2

USFWS WETLAND SYSTEM  Upland

RANGE
Globally
This community is common in Montana, Wyoming, and is in Nebraska, North Dakota, South Dakota, southern Saskatchewan, and southern Manitoba.

Fort Laramie National Historic Site
This community is most common on upland sites, especially on Bureau of Land Management lands south and northwest of the NHS. It also occurs in the northwest part of the NHS, and on the upper floodplain in the southwest part.

ENVIRONMENTAL DESCRIPTION
Globally
This community is found on flat to gently sloping sites, predominantly with sandy loam or loam soil. The soil is typically 40-100 cm deep (Hanson and Whitman 1938, Hansen et al. 1984).

Fort Laramie National Historic Site
This community occurs on sandy soils on level and rolling sites, and on slopes to 15 degrees. There is no apparent correlation with aspect.

**DIAGNOSTIC SPECIES**

*Globally*

*Stipa comata*, *Bouteloua gracilis*, *Carex filifolia*

**VEGETATION DESCRIPTION**

*Globally*

This midgrass prairie community is dominated by graminoids that are usually between 0.5 and 1 m tall. The vegetation cover is moderate. The dominant species are *Bouteloua gracilis*, *Carex filifolia*, and *Stipa comata*. *S. comata* usually has the most coverage of any single species. *Pascopyrum smithii* is constant in this community and can be locally abundant. *Carex duriuscula* is not always present but is also abundant at some sites. Forbs that are typical of this community are *Heterotheca villosa* var. *villosa*, *Guara coccinea*, *Liatris punctata*, and *Phlox hoodii*. Sandier areas often have *Calamovilfa longifolia* present. Shrubs rarely grow taller than the grasses, but *Artemisia frigida* is very common in this community. Other grasses that are likely to be present are *Aristida purpurea* var. *longiseta*, *Koeleria macrantha*, and *Sporobolus cryptandrus*. On 19 stands in west-central Montana the cover by the different strata was as follows: shrubs - 6%, graminoids - 67%, forbs - 11%, bryophytes - 14%, litter - 55%, rock 4%, bare soil - 9% (Mueggler and Stewart 1978). Thilenius et al. (1995) found that the average cover on 14 stands in eastern Wyoming was 42%. Tolstead (1942) described this community as the climax on the level lands of the northern part of Cherry County, Nebraska.

**Fort Laramie National Historic Site**

This community typically is dominated by *Stipa comata* and *Bouteloua gracilis*. The latter is the more dominant species in some areas, as can be *Carex filifolia*. Low shrubs are often present but sparse, the most frequent being *Artemisia filifolia* and *A. frigida*. *Tradescantia occidentalis* and *Opuntia fragilis* frequently occur in this community. The latter is occasionally abundant. *Andropogon hallii* occurs occasionally in small patches. Small patches of *Calamovilfa longifolia* are common. At two sites, very small stands of *Schizachyrium scoparium* were observed on steeper slopes within this type. In some areas, such as old disturbed areas on Bureau of Land Management land northwest of the park (pipeline), large stands of *Calamovilfa longifolia* are present. Herbaceous cover typically ranges from 40 to 75%, with heights typically between 0.5 and 1 m.

**RANK JUSTIFICATION**

**DATABASE CODE** CEGL002037

**COMMENTS**

Fort Laramie National Historic Site

This community is very similar to the *Stipa comata - Yucca glauca* Herbaceous Vegetation type in composition. However, shrub cover is less than 10% or may be absent. At some sites, especially on the BLM land south of the NHS, *Bouteloua gracilis* is dominant, and *Stipa comata* is rare or absent, probably due to grazing (*S. comata* is known to be a decreaser and *B. gracilis* an increaser in these situations; USDA Forest Service 1937). *Carex filifolia*, also an increaser (Jones 1992), contributes substantial cover in some areas.

USFWS WETLAND SYSTEM Upland

RANGE
Globally
This community is found only in Wyoming.
Fort Laramie National Historic Site
This community is most common on upland sites on Bureau of Land Management lands northwest and south of the NHS. *Artemisia filifolia* does occur in *Stipa comata - Bouteloua gracilis - Carex filifolia* Herbaceous Vegetation within the NHS but, at these sites, shrub cover usually is less than 10%.

ENVIRONMENTAL DESCRIPTION

**Globally**
Stands of the narrower *Stipa comata - Yucca glauca* Herbaceous Vegetation are found only along ridge tops and a short distance down the adjacent slopes (Thilenius et al. 1995). The broader *Yucca glauca / Calamovilfa longifolia* Shrub Herbaceous Vegetation, into which it is suggested *Stipa comata - Yucca glauca* Herbaceous Vegetation be placed, apparently occurs on a broader range of ridge tops and upper slopes.

Fort Laramie National Historic Site
This community occurs on sandy soils on rolling terrain and on slopes to 18 degrees. There is no apparent correlation with aspect.

DIAGNOSTIC SPECIES

**Globally**
*Yucca glauca, Calamovilfa longifolia, Stipa comata*

Fort Laramie National Historic Site
*Artemisia filifolia, Stipa comata, Bouteloua gracilis*

VEGETATION DESCRIPTION

**Globally**
Stands of the narrower *Stipa comata - Yucca glauca* Herbaceous Vegetation (Thilenius et al. 1995) contain an open to moderately-dense (at least 10% cover), low shrub layer above a species-rich herbaceous layer. Dominance of the shrub layer by *Yucca glauca* is characteristic (average cover in 6 stands was 9.8%). *Artemisia tridentata ssp. wyomingensis* and *Artemisia cana ssp. cana* may be present but are sparse and contribute little cover. In the herbaceous layer, *Stipa comata and Calamovilfa longifolia* co-dominate (16% cover and 8% cover respectively), and *Bouteloua gracilis* and *Carex filifolia* often are present but contribute much less cover than do *Stipa or Calamovilfa*. Forbs are common but contribute little cover; *Artemisia frigida* has the highest constancy, but no forb is characteristic of the association. Litter covers up to ca. half of the ground surface, and most of the rest of the ground surface is bare soil.

Fort Laramie National Historic Site
This community typically is dominated by *Stipa comata and Bouteloua gracilis* in the herbaceous stratum, with greater than 10% low shrub cover dominated by *Artemisia filifolia*. *Yucca glauca* can be common as well. *B. gracilis* is the more dominant herbaceous species in some areas, as is *Carex filifolia*. *Tradescantia occidentalis* and *Opuntia fragilis* frequently occur in this community. The latter is occasionally abundant. *Andropogon hallii* occurs occasionally in small patches. Small patches of *Calamovilfa longifolia* are common. In some areas, such as old disturbed areas on Bureau of Land Management land northwest of the park (pipeline), large stands of *Calamovilfa longifolia* occur.

COMMENTS

_Globally_

This association is currently considered a temperate, mid-grass, bunchgrass grassland. But as described by Thilenius et al. (1995), the reference from which it was named, it is characterized by a low shrub layer of at least ca. 10% cover, and so should probably be considered a sparse shrub type in the Yucca glauca Shrub Herbaceous Alliance (V.A.7.N.h. in TNC’s national vegetation hierarchy) and renamed Yucca glauca / Stipa comata Shrub Herbaceous Vegetation.

Furthermore, it appears to be the same as the Yucca glauca / Calamovilfa longifolia Association (CEGL001456) from Montana, as suggested by the following evidence. First, the two types are markedly similar in species composition. Percent constancy and percent canopy cover of the major species in the Yucca glauca / Calamovilfa longifolia association are as follows (Prodgers 1978): Yucca glauca 100% (22.5%), Stipa comata 33% (0.2%), Calamovilfa longifolia 83% (15.6%), Schizachyrium scoparium 67% (11.3%), Bouteloua gracilis 67% (3.2%), Carex filifolia 50% (5.6%). In the Yucca glauca / Stipa comata shrub-steppe, percent constancy and percent canopy cover of the major species are quite similar (Thilenius et al. 1995): Yucca glauca 100% (9.8%), Stipa comata 100% (16.3%), Calamovilfa longifolia 100% (8.7%), Schizachyrium scoparium not listed; Bouteloua gracilis 83% (8.2%), Carex filifolia 83% (7.1%).

Second, stands of the two types occur on similar substrates. Stands of the Yucca glauca / Calamovilfa longifolia association occur on sandstone and scoria substrates (Prodgers 1978), and stands of the Yucca glauca / Stipa comata shrub-steppe occur on sandstone outcrops (Thilenius et al. 1995). Third, the authors of the Yucca glauca / Stipa comata shrub-steppe (Thilenius et al. 1995) originally identified a Yucca glauca / Calamovilfa longifolia type on sandstone outcrops and sandy soils, based on a reconnaissance of vegetation in the Cheyenne River Basin. They then sampled 6 stands and revised their original type to the Yucca glauca / Stipa comata shrub-steppe of sandstone outcrops. Surveys by George Jones in the Cheyenne River Basin suggest that the original concept of the Yucca glauca / Calamovilfa longifolia type on sandstone outcrops and sandy soils applies well to the vegetation.

_Fort Laramie National Historic Site_

This community intergrades with Stipa comata - Bouteloua gracilis - Carex filifolia Herbaceous Vegetation. At some sites, especially on the BLM land south of the NHS, Bouteloua gracilis is dominant, and Stipa comata is rare or absent, probably due to grazing (S. comata is known to be a decreaser and B. gracilis an increaser in these situations; USDA Forest Service 1937). Carex filifolia, also an increaser (Jones 1992), contributes substantial cover in some areas. Low shrubs occasionally contribute greater than 25% cover. However, these stands are included in this community rather than being segregated as a shrubland community.

DIAGNOSTIC SPECIES
Globally
Bouteloua gracilis, Carex filifolia

Fort Laramie National Historic Site
Paronychia depressa, Heterotheca villosa, Hymenopappus acaulis

VEGETATION DESCRIPTION
Globally
Bouteloua gracilis and Carex filifolia are both dominant members of the herbaceous stratum. Stipa comata, Calamovilfa longifolia, Artemisia frigida, Comandra umbellata ssp. pallida, and Astragalus spatulatus can also be found. Short shrubs, such as Rhus trilobata and Yucca glauca, are sometimes scattered in this community.

Fort Laramie National Historic Site
This community is forb-rich (in comparison with other grassland types). The herbaceous stratum is quite low (typically less than 20 cm in height) with variable cover ranging from 10 to 75%. On broader ridgecrests, soils may be cobbly, but herbaceous cover is greater, with grass species dominant.

OTHER NOTEWORTHY SPECIES Information not available.

DIAGNOSTIC SPECIES
Globally
*Typha latifolia*

**VEGETATION DESCRIPTION**

*Globally*
This community is dominated by hydrophytic macrophytes, especially *Typha latifolia*, which grow to approximately 2 meters. *T. latifolia* can form dense stands in places, almost to the exclusion of other species. Other species typical of wetlands are found in lesser amounts in this community. Among these are *Carex* spp. and *Scirpus* spp.

**Fort Laramie National Historic Site**
This community consists of stands of *Typha latifolia*, typically 1-2 m tall. Coverage is typically 50-75%. Standing water may or may not be present, depending on the season.

**OTHER NOTEWORTHY SPECIES** Information not available.

**CONSERVATION RANK** G5

**RANK JUSTIFICATION**

**DATABASE CODE** CEGL002010

**COMMENTS**

*Globally*
This community is a common element found in many wetland systems, but has received little attention. Consequently, the diagnostic features and species of this community are not well known.

**Fort Laramie National Historic Site**
At least one stand contained plants that were suggestive of *Typha angustifolia*, and the study area is within the range of the species (Dorn 1992). In this species, the staminate and pistillate spikes are not contiguous, being separated by 1-8 cm of bare rachis. However, spikes in *T. latifolia* occasionally are not contiguous (to 4 cm of bare rachis), and intermediate hybrids between the two species are not uncommon (Great Plains Flora Assoc. 1986). In plants observed at Fort Laramie NHS, the bare rachis was quite short (less than 1 cm).

Globally

This community is found in western South Dakota, western Nebraska, and eastern Wyoming.

*Fort Laramie National Historic Site*

This community occurs on upland sites on Bureau of Land Management lands northwest and south of the NHS. It is best developed on the northerly escarpment above the canal northwest of the NHS.

ENVIRONMENTAL DESCRIPTION

Globally

This community is found on loamy, sandy, or rocky soil. It is usually found on gentle to moderate slopes at low elevations in the Black Hills of South Dakota (Hayward 1928).

*Fort Laramie National Historic Site*

This community was observed on sandy silty soils derived from whitish, soft sandstone, on levels sites and slopes to 30 degrees. It occurs on all aspects except south, but is best developed on northerly exposures (northwest through northeast). Sandstone outcrops are common. The larger are mapped as the Rock Outcrop type.

DIAGNOSTIC SPECIES

Globally

*Pinus ponderosa, Schizachyrium scoparium*

*Fort Laramie National Historic Site*

*Pinus ponderosa, Schizachyrium scoparium*

VEGETATION DESCRIPTION
Globally
This community has scattered mature trees with a fairly continuous graminoid understory. *Pinus ponderosa* is the most abundant tree species, sometimes with *Juniperus scopulorum* present as small trees or tall shrubs (Steinauer 1989). The most abundant graminoids in the understory are *Schizachyrium scoparium*, *Stipa comata*, *Carex filifolia*, *Bouteloua gracilis*, and *B. curtipendula*. *Calamovilfa longifolia* and *Koeleria macrantha* may be found on sandy soils in the eastern part of this community's range. Forbs that may be present include *Gaura coccinea*, *Psoralidium lanceolatum*, and *Asclepias pumila*. In addition to the herbaceous species, shrubs such as *Symphoricarpos occidentalis*, *Rhus trilobata*, and *Cercocarpus montanus* are sometimes found in this community.

Fort Laramie National Historic Site
This community consists of sparse canopy dominated by *Pinus ponderosa*. Distribution is quite patchy, but probably averages greater than 10%. Trees are short, typically less than 10 m in height. Scattered individuals of *Juniperus scopulorum* commonly are found at these sites. The shrub stratum also is sparse, but *Rhus trilobata* occurs fairly consistently. Herbaceous dominants vary, with *Schizachyrium scoparium* being the most common. However, *Bouteloua gracilis*, *Carex filifolia*, and/or *Pseudoroegneria spicata* can be locally abundant. Herbaceous cover usually is less than 25%, but can be greater, especially under canopy openings.

OTHER NOTEWORTHY SPECIES Information not available.

COMMENTS

Globally
Periodic fires are probably important in maintaining the open grassland understory of this type.

Fort Laramie National Historic Site
Sandstone outcrops are common in this community. The larger are mapped separately as Sandstone Rock Outcrop Sparse Vegetation.

RANK JUSTIFICATION

DATABASE CODE  Not applicable
COMMENTS

Fort Laramie National Historic Site

*Bromus tectorum* contributes significantly more cover early in the season. The large forbs become more significant late season. *B. tectorum* also occurs as a significant component in some of the grassland communities, especially in the *Sporobolus cryptandrus* type.

This community is a result of extensive disturbance with subsequent invasion by weedy exotic or native species. Thus, it is not placed within the National Vegetation Classification System. This community is included for possible future management considerations and represents a relatively insignificant entity within the flora.

RANGE

Globally

This type has been found only at Fort Laramie. It is likely that further review will identify it in other states as well.

Fort Laramie National Historic Site

The rock outcrop type occurs predominantly on Bureau of Land Management land northwest of the NHS, where it is best developed on the northerly escarpment that drops down to the Laramie River floodplain. Smaller outcrops also occur on BLM lands south of the NHS.

ENVIRONMENTAL DESCRIPTION

Globally

Information not available.

Fort Laramie National Historic Site

The rock outcrop type consists of whitish, soft sandstone of Miocene age (Love and Christiansen 1985).

RANGE

Globally
This community occurs in Illinois, Missouri, Minnesota, Nebraska, eastern Wyoming, southern Saskatchewan, southern Manitoba, southern Ontario, and possibly Indiana and North Dakota.

Fort Laramie National Historic Site
This community occurs adjacent to the Laramie and Platte Rivers.

ENVIRONMENTAL DESCRIPTION

Globally
This community is found on rivers and streams where frequent flooding changes the substrate. Soil is absent or sometimes poorly developed. Soil that is above the water table is prone to drought due to poor water retaining capability. Parent material is sand or gravel.

Fort Laramie National Historic Site
This community occurs on sandy, gravelly and small-cobble soils adjacent to rivers. Soil type can change relatively rapidly (over several years?) with flood events.

DIAGNOSTIC SPECIES

Globally
Information not available.

Fort Laramie National Historic Site
No species sufficiently constant to be diagnostic.

VEGETATION DESCRIPTION

Globally
Vegetation cover is sparse to sometimes moderate in this community. Ground cover is in the range of 5-20%. The predominant vegetation is herbaceous although some young shrubs and trees may become established. Species composition is variable from site to site and on the same site due to frequent flooding and recolonization from nearby seed sources. Species commonly found in the herbaceous layer include *Cenchrus longispinus*, *Cyperus* spp., *Eragrostis trichodes*, *Equisetum* spp., *Juncus* spp., *Polygonum lapathifolium*, and *Sporobolus cryptandrus*. Small *Populus deltoides* and *Salix* spp. are the most common woody species.

Fort Laramie National Historic Site
This community is characterized by sparse herbaceous and shrub cover, typically 1-10%. The vegetation composition and structure can change rapidly as a result of flooding. *Salix exigua* and small *Populus deltoides* are
the most abundant shrubs while *Sporobolus cryptandrus*, *Artemisia campestris*, and *Melilotus* spp. are typically found in the herbaceous layer. Small patches of *Spartina pectinata* sometime occurs in wet areas near the river.

**OTHER NOTEWORTHY SPECIES**  Information not available.

**RANK JUSTIFICATION**

**DATABASE CODE**  CEGL002049

**COMMENTS**

_Globally_  
This is a primary community that develops on recently deposited or disturbed alluvial sand and gravel. It is a short lived community. Either subsequent flooding destroys the plants or secondary communities develop on the site.

_Fort Laramie National Historic Site_  
Succession to and from *Salix exigua* Shrubland may occur rapidly (within a few years) depending on the extent of seasonal flooding.

COMMENTS
Globally
This community has not been described other than at Fort Laramie NHS. It likely occurs elsewhere, but it needs further review for a complete rangewide description.

Fort Laramie National Historic Site
Sites away from the river (washes and blowouts) are somewhat different than floodplain occurrences. *Opuntia polyacantha* can occur at these sites, but *Artemisia campestris* was not observed. *A. filifolia* is occasional; *Ambrosia psilostachya* and *Calamovilfa longifolia* also were locally common.
